It is a common misconception that cloud-hosted services and infrastructure (SaaS and IaaS) are turn-key propositions that require less skill than self-hosted platforms to plan, deploy, operate and maintain. The reality is that a well-rounded book on the topic - like MSFT O365 Administration - must spend roughly 200 pages discussing planning tools and directory services, before even touching on O365 management. If considering an O365 deployment, you want this book in the arsenal. The book is written for "Information Technology (IT) system architects who need to integrate
Office 365 with existing on-premises technologies," but it is equally useful to everyone in the traditional TechNet audience, including IT Operations teams and infrastructure experts (IT Pros). Extensive attention is given to System Center monitoring and management (via SCOM, DPM, VMM, SCO, etc.), and SCOM alerts. Another chapter helps you install Orchestrator. Another covers Service Manager automation. By this time we’re 400 pages deep and getting into remote administration with PowerShell. But wait, there’s more! At this point the tenancy is configured complete with monitoring and management, but we haven’t gone deep on any of the actual services - SharePoint Online, SkyDrive Pro, Exchange, and Lync. The content is roughly proportional to the pain: Exchange integration gets the heaviest treatment, followed by SharePoint and Lync. The SharePoint online coverage is terrific in describing SP’s topology and constraints, and the App Store model used to add features.
